WEBSITE STATUS CHECKER

This project is developed using Python to check whether a website is online or offline by analyzing its HTTP status code.

Objectives

• To learn Python networking basics.

• To understand HTTP status codes.

• To check website availability.

• To improve beginner Python programming skills.

Software Requirements

Software	Purpose
Python	Programming Language
Requests Library	Send HTTP Requests
VS Code / PyCharm	Code Editor

Python Program

```
import requests

url = input("Enter website URL: ")

try:
    response = requests.get(url)

    print("HTTP Status Code:", response.status_code)

    if response.status_code == 200:
        print("Website is Online")

    elif response.status_code == 404:
        print("Page Not Found")

    elif response.status_code == 500:
        print("Server Error")

    else:
        print("Other Status Detected")

except requests.exceptions.MissingSchema:
    print("Invalid URL")

except requests.exceptions.ConnectionError:
    print("Connection Error")

except Exception as e:
    print("Error:", e)
```

Sample Output

```
Enter website URL: https://google.com
HTTP Status Code: 200
Website is Online
```

Common HTTP Status Codes

Status Code	Meaning
200	Website Working
301	Redirected
403	Forbidden
404	Page Not Found
500	Internal Server Error
503	Service Unavailable

Conclusion

The Website Status Checker project helps beginners understand how websites communicate using HTTP protocols. It also improves Python programming and networking knowledge.

Viva Questions

1. What is HTTP?
2. What is status code 200?
3. Why is requests library used?
4. What is exception handling?
5. What is a GET request?
