

PORT SCANNER PROJECT REPORT

Project Title: Port Scanner using Nmap
Target Host: scanme.nmap.org
Prepared For: Academic Project Submission

Objective:

The objective of this project is to perform a network port scan on a target host using Nmap and analyze the open ports, services, and protocols available on the server.

Methodology:

The scanning process was carried out using the TCP SYN scanning technique. The scanner checked the top 1000 TCP ports and identified active services running on the target machine.

Scan Information

Parameter	Value
Host	scanme.nmap.org
IP Address	45.33.32.156
Protocol	TCP
Scan Type	Light Scan
Ports Scanned	Top 1000 Ports
Scan Technique	TCP SYN
Scan Duration	13 Seconds

Open Ports and Services

Port	Protocol	State	Service	Version
22	TCP	Open	SSH	OpenSSH 6.6.1p1 Ubuntu
80	TCP	Open	HTTP	Apache httpd 2.4.7 (Ubuntu)

Analysis:

The scan results show that the target system has two open ports: Port 22 for SSH remote access and Port 80 for HTTP web services. These services are commonly used in Linux servers for secure remote administration and website hosting.

Conclusion:

This project successfully demonstrated the process of network scanning using Nmap. The report identified active services and open ports on the target host. Port scanning is an important technique in cybersecurity and network administration for identifying exposed services and improving system security.
